CAMPUS BAKERY POS

Presented to the

Institute of Computing

Davao del Norte State College

Panabo City, Davao del Norte

In Partial Fulfillment

of the Requirements for the Degree

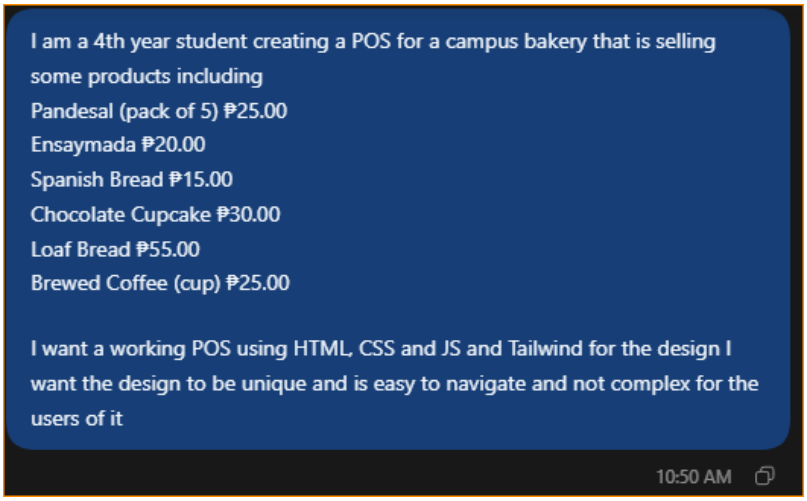

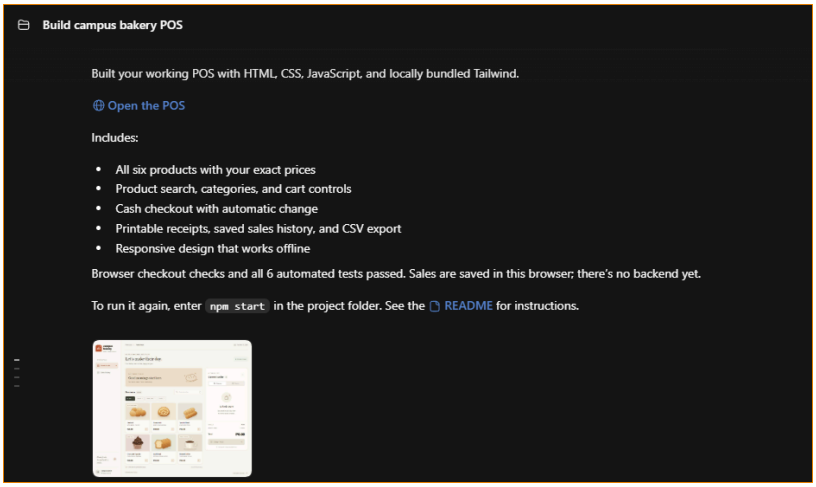

BACHELOR OF SCIENCE IN INFORMATION TECHNOLOGY

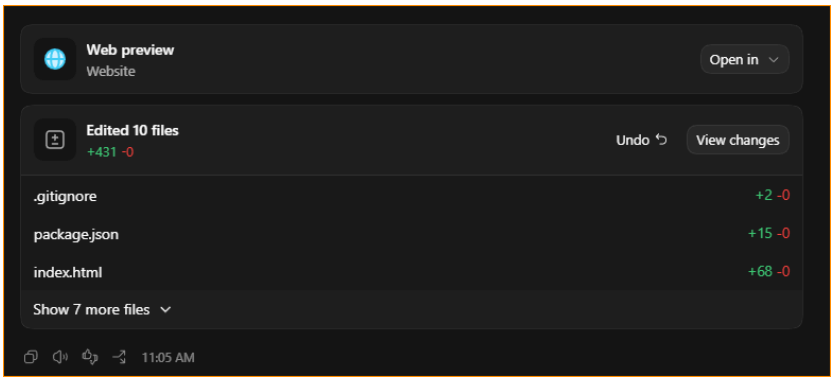

Joshua L. Eltagonde

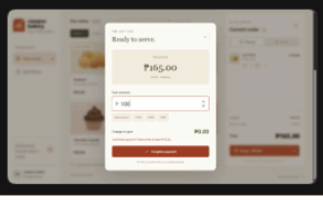

Zyrou V. Juntilla

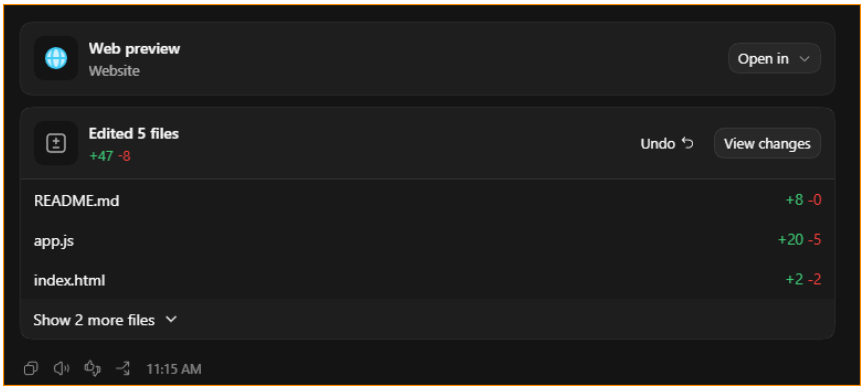

OCTOBER 2026

Initial Prompt

INITIAL PROMPT	
PURPOSE	The purpose of this prompt is to guide AI in developing a functional and user-friendly Point of Sale (POS) system for a campus bakery. It provides clear instructions about the products, prices, features, design, and programming languages to be used. Through AI-assisted prompting, the goal is to create a simple, organized, and efficient system that helps cashiers manage customer orders, calculate payments, and generate receipts accurately.
AI Response	

	
EVALUATION	Partially Correct The AI response was partially correct because it understood the requirements and provided a structured approach to developing the campus bakery POS system. It included the specified products, prices, programming languages, and design preferences. However, the actual functionality of the system still needs to be tested to ensure that all features, such as adding products, calculating totals, processing payments, and generating receipts, work correctly.
MODIFICATIONS	We modified the code by replacing the existing product images with realistic, high-quality photos of the bakery products. This improvement made the POS system more visually appealing, professional, and easier for users to recognize and identify the products.

SECOND PROMPT	also check if these required common features are present in the current POS Display at least five (5) products with their names and prices. 2. Allow the user to add products to the cart through on-screen buttons. 3. Allow the user to increase and decrease the quantity of items already in the cart. 4. Allow the user to remove a product from the cart. 5. Automatically compute each item's subtotal and the overall total amount whenever the cart changes. 6. Display a clear order summary showing all items currently in the cart. 7. Accept cash payment through a numeric input field. 8. Validate the payment amount: reject blank, non-numeric, negative, and insufficient amounts, each with a clear on-screen message. 9. Calculate the correct change (Change = Amount Paid − Total Amount) for a valid, sufficient payment. 10. Display a clear payment confirmation after a successful payment. 11. Generate a simple digital receipt containing the items, quantities, subtotals, total amount, amount ... Show more
PURPOSE	The purpose of this prompt is to check whether the current POS system includes all the required features and functions. It aims to ensure that the system can properly manage products, update cart quantities, calculate totals, process payments, validate user inputs, and generate receipts accurately.
AI RESPONSE	Worked for 2m 33s Checked all 12 requirements. **All are now present**, with two fixes: • Blank, non-numeric, and negative payments show **"Please enter a valid payment amount."** • Insufficient payments show **"Insufficient payment. Please enter at least ₱165.00."**, using the actual order total. • **New transaction** clears the cart, payment amount, and digital/print receipt. Completed sales remain in history. The other features—including quantity controls, removal, automatic totals, confirmation, and receipt reference—were already present. Browser checks and all **8 automated tests passed.** Open the updated POS 

	
EVALUATION	Partially Correct The AI response was partially correct because it addressed the required features of the POS system and helped identify areas that needed improvement. However, some functions still needed further testing and modifications to ensure that all features worked correctly and the system operated smoothly.
MODIFICATIONS	We modified the POS system code by improving the cart management, payment validation, and receipt generation features. We added input validation to prevent invalid or insufficient payments, ensured that product quantities and total prices were calculated correctly, and improved the order summary to display accurate transaction details. These modifications were made to improve the system's functionality, accuracy, and user experience.
